Greater Reassurance During Everyday Journeys

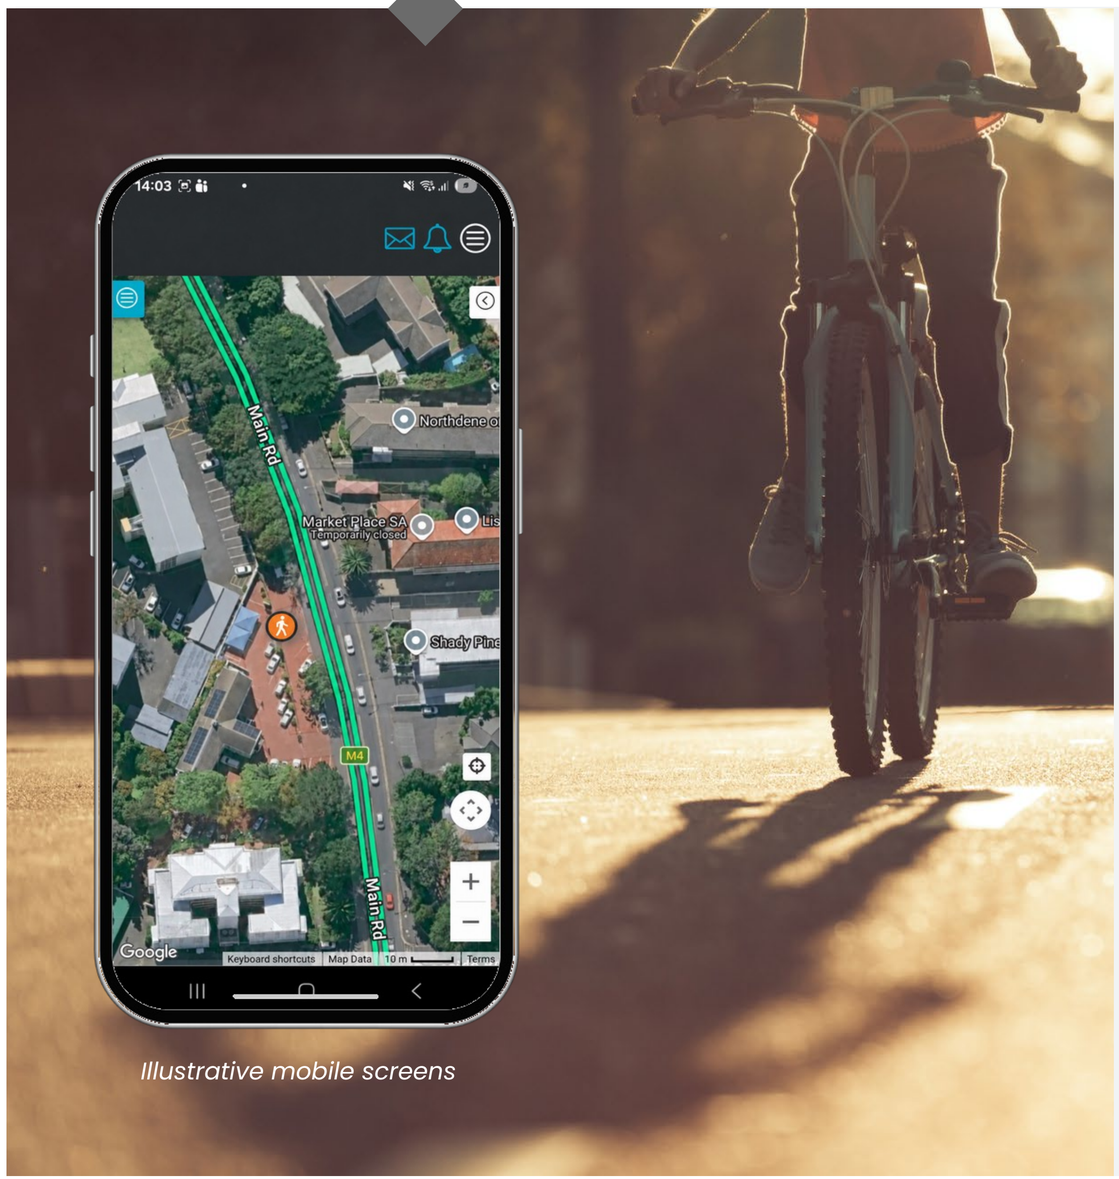

People move between home, school, work and other familiar places every day.

When plans change or someone does not arrive when expected, families and designated contacts need an easier way to understand where they are.

Key questions

- Are they still **traveling**?
- Have they reached their **destination**?
- Is the journey **taking longer** than expected?
- Do they need **assistance**?

Mobile tracking provides useful information when reassurance or assistance is needed.

Illustrative mobile screens

How mobile personal tracking works

The service connects the person traveling with the people looking out for them.

- **Location shared**

  The individual activates tracking through the tracking app on their phone.

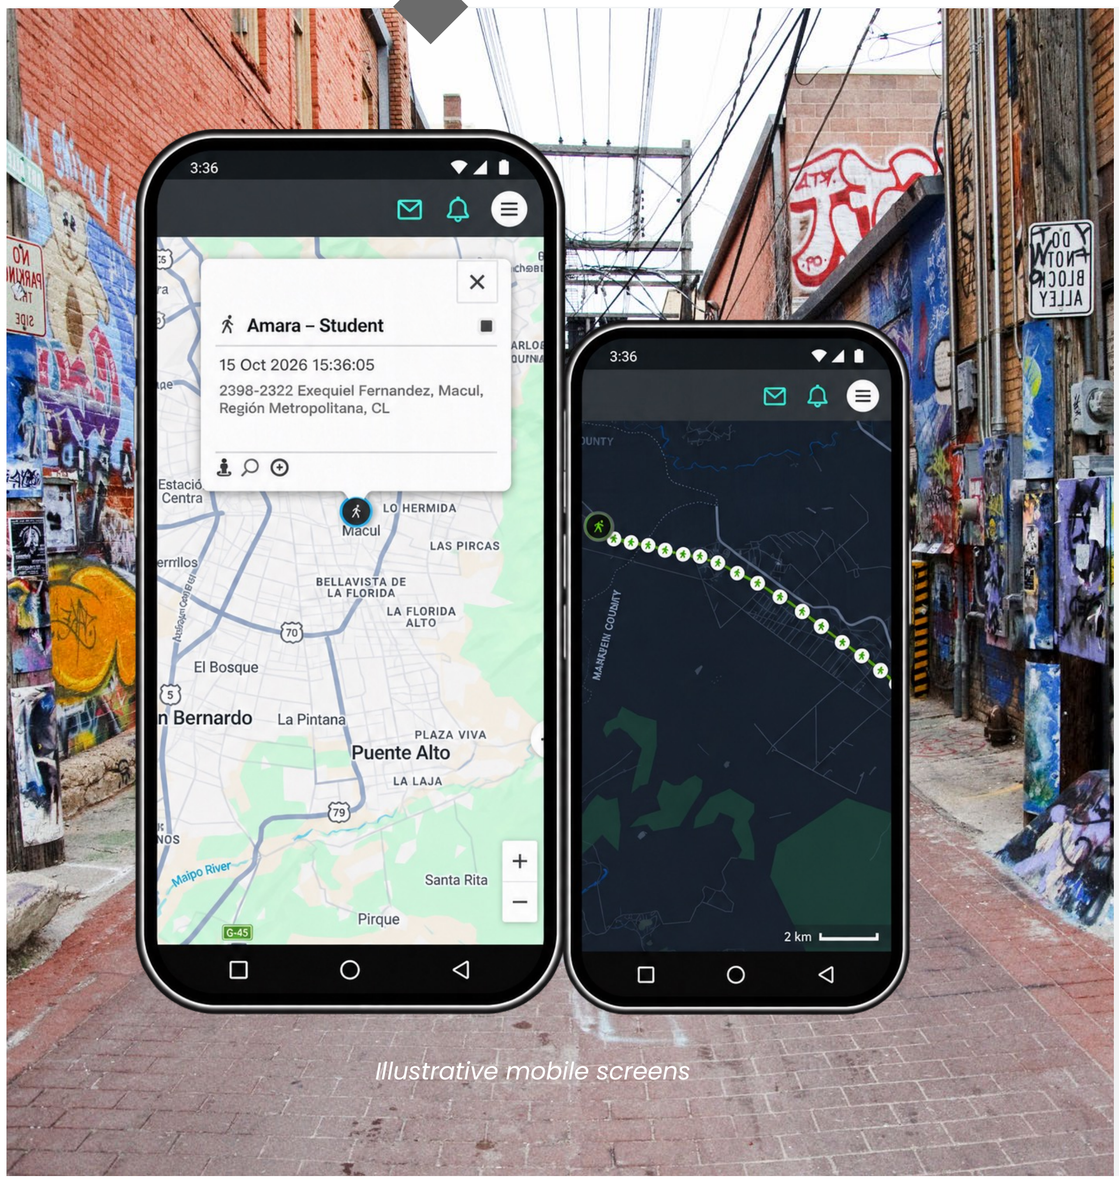

- **Journey monitored**

  Their location and movement become visible to authorized users through the mobile monitoring service.

- **Attention requested**

  An SOS request or configured safety event can notify the appropriate contact or monitoring team.

One connected service for the person traveling and the people looking out for them.

Illustrative mobile screens

Know where they are and where they've been

The mobile monitoring service gives authorized users access to a person's current or most recently reported location, together with recent journey history.

Current location

- View their latest position on the map
- Check where their location was last reported

Journey history

- Review previous movement and the route taken
- Follow progress between familiar places such as home, school or work

Clearer information from departure to arrival.

Request help when it matters

SOS and configured safety alerts help families, designated contacts and monitoring teams recognize when someone may need attention.

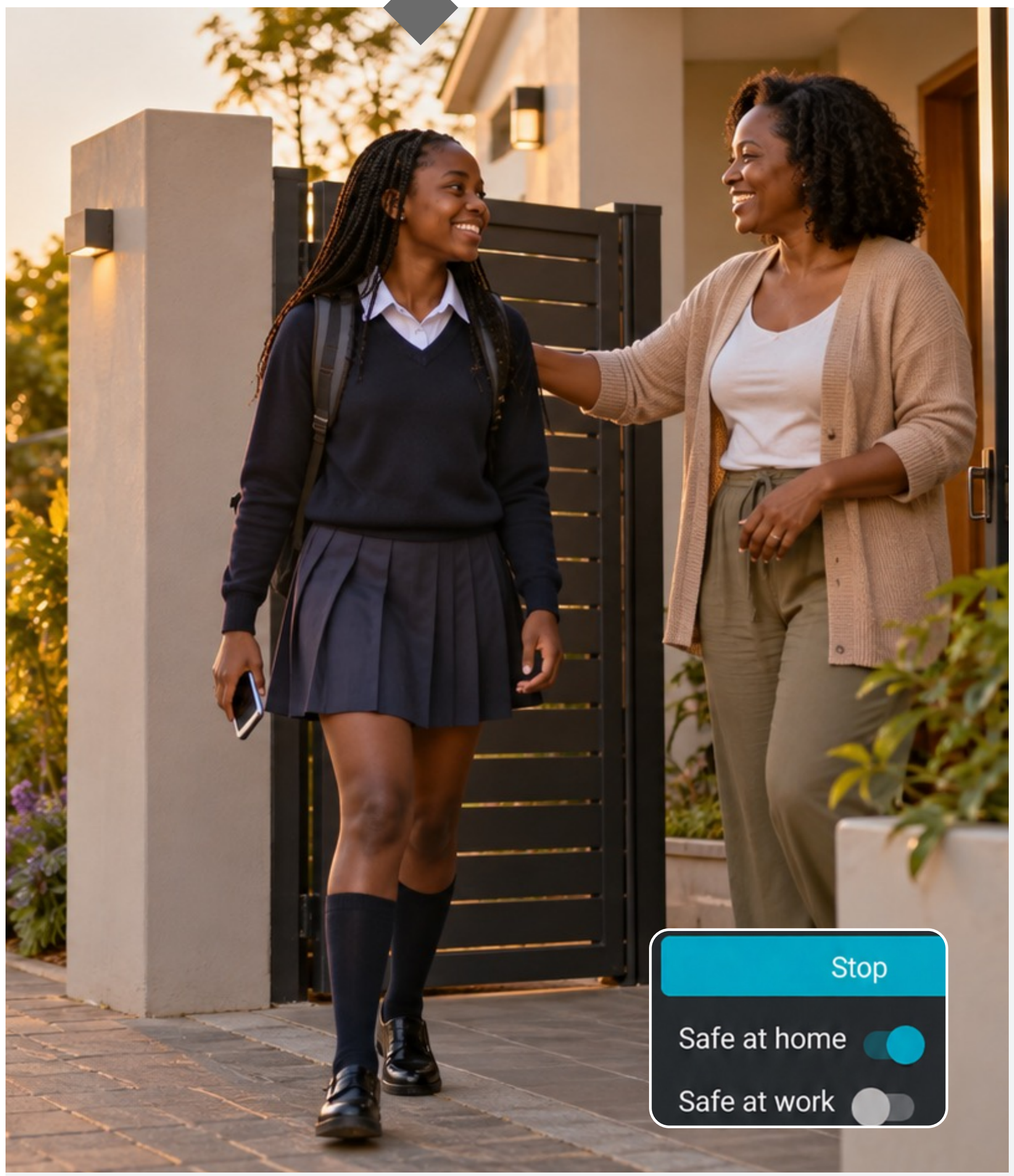

Available alert types

- **SOS** – Panic Button Alert
- **Journey progress** – Location Journey Alert
- **Missed arrival** – POI Non-Entry Alert
- **Restricted area** – No-Go Zone Alert

When SOS is activated

The platform generates an alert and makes the person's location visible to the appropriate authorized users.

The right information can reach the right people sooner.

Use case: Amara’s journey home

The Challenge

Amara travels home from school independently. Her family wants reassurance without repeatedly calling her for updates.

- **Leaving school**
  Amara activates tracking before beginning her journey.
- **During the journey**
  Her authorized family member can check her reported location through the monitoring service
- **Arrival expected**
  Home is configured as a familiar location.
- **Attention needed**
  If Amara does not enter the expected location, an alert can be generated. She can also activate SOS if she needs assistance.

Outcome

Her family has clearer information, while Amara retains the freedom to complete her journey independently.

The same service can support students, drivers, mobile employees and loved ones traveling independently.
